

Surviving the Singularity: Project Status

Christopher Tavalazzi

June 12, 2026

Live site: survivingthesingularity.com | **Written as:** The Coffee Jesus

What This Is

Surviving the Singularity is a book-in-progress with a companion website. The premise: a practical, satirical field manual for people who want to stay agentic as AI rewrites work, money, medicine, and meaning. The voice is conversational, darkly funny, and direct, with a 60/30/10 balance of information, humor, and reflection.

The site is an open draft. Everything is free to read. No login, no paywall. The book ships when it ships.

Platform Status: Live and Launch-Ready

The SvelteKit site is deployed on Cloudflare Pages and fully functional.

Route	Status
/	Live. Landing page with thesis, interactive diagrams, savings calculator, chapter index
/why	Live. The case: AGI timeline, expert voices, benchmarks
/book	Live. Open draft with chapter previews, Buy CTA wired (renders when purchase URL is set)
/blueprint	Live. Eight-chapter independence blueprint with dynamic section pages
/blog	Live. Dispatches
/checklist	Live. Email-gated content
/shouse	Live. Shouse Builder 3D strategy game
/about	Live
/preorder	Not built. Planned as Phase 2 (Stripe)

Recent platform work (33 commits in 2026 so far):

- Email capture funnel with Supabase waitlist, gated checklist, and nav overhaul
- Free sample PDF (`StS-free-sample.pdf`) downloadable from the book page
- Buy CTA on `/book` that activates the moment a purchase URL exists
- `LAUNCH.sh` : a one-command deploy script waiting only on the Gumroad product URL
- Mobile readability facelift, responsive audit, viewport fixes
- Interactive pillar/divergence/window diagrams on the landing page
- Shouse Builder 3D strategy game
- Legal hygiene: clickwrap consent, canonical disclaimer, policy cleanup

Translation: the storefront is built. It is waiting on the product.

Manuscript Status: Two Drafts, No Canonical Version Yet

The book content lives in two parallel directories, and this is the central open question of the project.

Draft A: `book-draft-v2` (~39,500 words)

The fuller draft. Twelve chapters plus introduction, epilogue, glossary (two versions), further reading, and index.

Chapter	Words		Chapter	Words
1. What the Hell is Going On?	2,144		7. Love in the Time of Algorithms	6,857
2. Show Me the Money	2,437		8. Lights, Camera, Algorithm!	926
3. Your AI BFF	3,056		9. AI for President	3,370
4. Dr. AI Will See You Now	2,467		10. Money Never Sleeps	943
5. School of the Future	4,088		11. The Singularity	785
6. When Robots Get Creative	5,492		12. So Long, and Thanks for All the Data	827

Problem: wildly uneven. Chapter 7 is 6,857 words; chapters 8, 10, 11, and 12 are under 1,000. Chapter 11 (the literal title chapter) is the second-shortest in the book.

Draft B: `book-editing` (~29,300 words)

A separate editing pass with its own structure, including a `book.json` manifest and a back-cover blurb that Draft A lacks.

Chapter	Words		Chapter	Words
1	2,074		7	1,057
2	1,140		8	5,945
3	1,226		9	2,441
4	941		10	1,070
5	992		11	2,604
6	974		12	2,298

Notable: the two drafts are nearly mirror images. Where Draft A is long, Draft B is short, and vice versa. Draft B has a real Chapter 11 and 12 (2,604 and 2,298 words) where Draft A has stubs. Draft A has rich middle chapters where Draft B is thin.

The opportunity: a merged best-of-both manuscript would land around 45,000 to 50,000 words, which is solid territory for this genre of trade nonfiction.

Supporting Editorial Assets (already written)

- `EDITING_STRATEGY.md` : global edit plan plus chapter-by-chapter notes
- `WRITING_CHECKLIST.md` : voice and structure quality gates
- Style guide: full documentation of the “Dynamic Satirical Commentary” voice
- Glossary with definitions, further reading, index, acknowledgements, back cover

EPUB Status: Not Started

This is the next milestone. No `.epub` file exists anywhere in the project yet.

What we have going for us:

- All content is already clean Markdown with a numbered file order
- `book.json` manifest exists in the `book-editing` draft for structure
- Pandoc 3.6.4 is installed locally, which converts ordered Markdown directly to EPUB with metadata, cover, and CSS
- Front and back matter (acknowledgements, glossary, further reading, back cover) already exist as files

What the EPUB needs before it can be built:

1. **Pick the canonical draft.** Merge Draft A and Draft B, or anoint one and pull the best chapters from the other. This is the single decision blocking everything downstream.
2. **Fill the thin chapters.** Whichever draft wins, four-plus chapters need real content.
3. **Cover image.** No cover asset exists yet.

4. **Metadata file.** Title, author, ISBN (if desired), publisher, rights. Trivial once decided.
 5. **EPUB CSS.** A small stylesheet for chapter headings, callouts, and the interactive-element boxes (Reality Check, Future Forecast, Survival Strategy, Your Turn).
 6. **Build script.** A repeatable `make epub` style command so every manuscript edit can regenerate the book in seconds. Roughly an afternoon of work once items 1 and 4 exist.
-

Distribution and Monetization

Channel	Status
Email waitlist	Live (Supabase, with localStorage fallback)
Free sample PDF	Live on <code>/book</code>
Gumroad	Pending. <code>LAUNCH.sh</code> is written and waiting on the product URL
Stripe pre-orders	Planned (Phase 2 roadmap documented in <code>docs/PREORDER-ROADMAP.md</code>)
Substack	Live channel for chapter drops and launch alerts

The Critical Path

Everything funnels to one sequence:

1. **Decide the canonical manuscript** (merge strategy for the two drafts)
2. **Write/expand the thin chapters** to bring every chapter to fighting weight
3. **Build the EPUB pipeline** (pandoc + metadata + CSS + cover)
4. **Create the Gumroad product** with the EPUB as the deliverable
5. **Run `LAUNCH.sh`** and announce on Substack

The website, the funnel, the sample, and the buy button are all done. The remaining work is the book itself and the EPUB that packages it.

Bottom Line

This project is in the classic 80/20 endgame. The platform is launch-ready and has been polished extensively through 2026. The manuscript has roughly 50,000 words of material written across two drafts but needs one consolidation pass to become a single coherent book. The EPUB is unbuilt but cheap to build once the manuscript is canonical, since the entire toolchain (Markdown source, pandoc, file ordering, front and back matter) is already in place.

Shortest path to revenue: consolidate the drafts, build the EPUB, ship on Gumroad.
